FEATURED SPEAKER

ABDUL SALEEM

**PROJECT MANAGER
UAE**

The screenshot displays a Streamyard live stream interface. In the top left corner, there is a logo for 'AILEGEND' featuring a shield with a figure inside. The top right corner shows the 'streamyard' logo. The main content area is a presentation slide titled 'Inventions Of Cardio Chip or AI Device'. The slide lists five items:

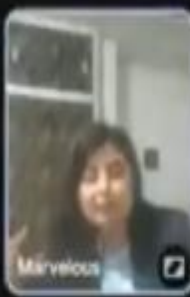

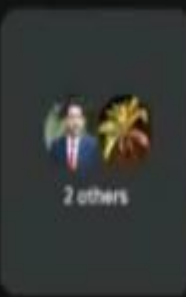

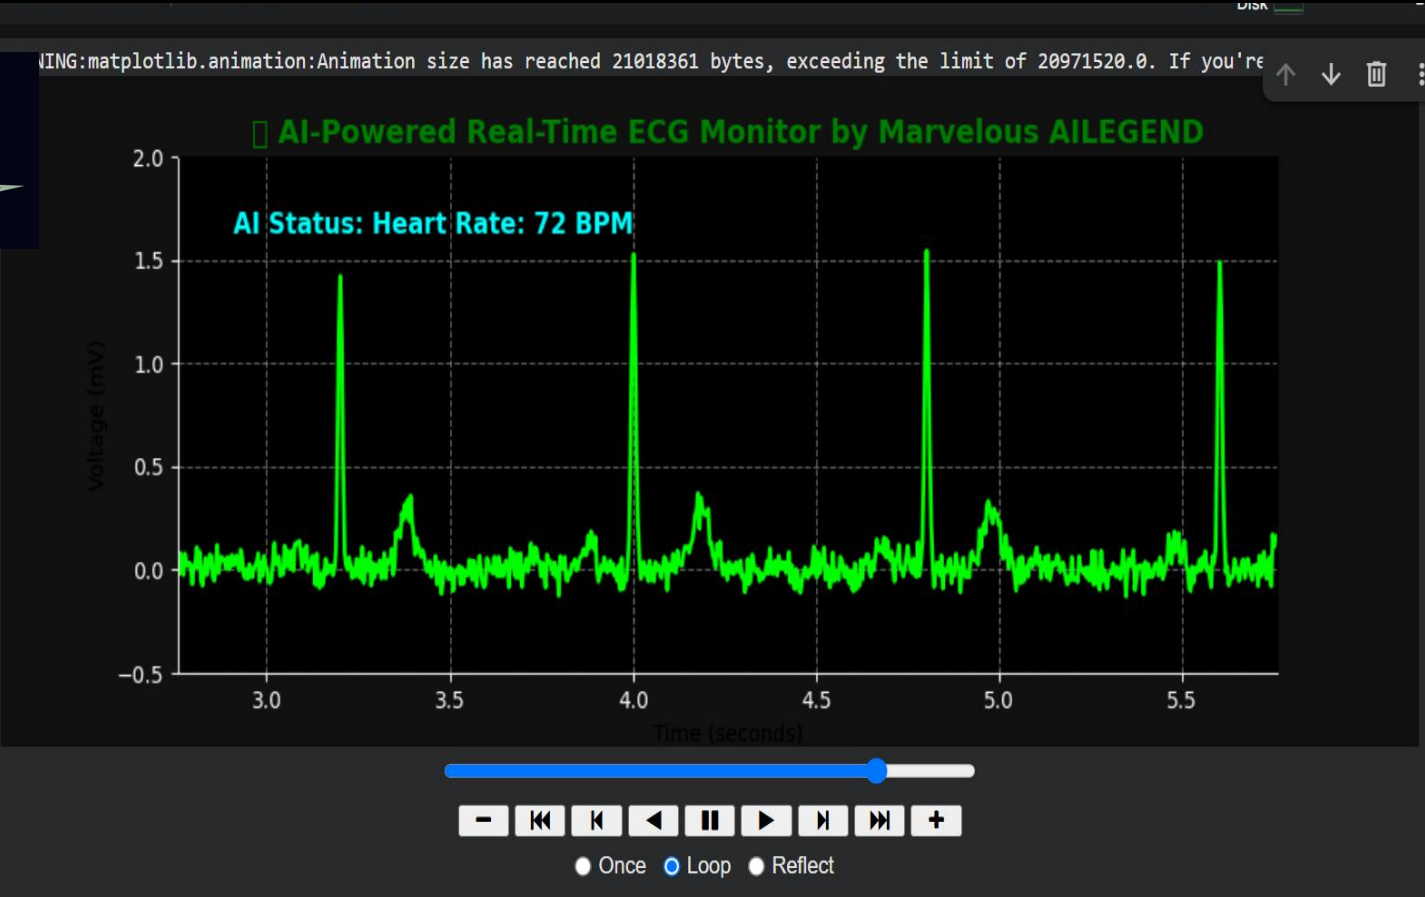

1. 1998 (Medtronic): Founded by Earl Bakken | Reveal™ ICM | Uses Pattern Recognition for waveforms.
2. 2017 (Abbott): Founded by Dr. Wallace Abbott | Confirm Rx™ | Uses Deep Learning for voltage anomalies.
3. 2018 (Smartwatches): Pioneered by Apple | Apple Watch S4 | Uses Cloud Neural Networks for wrist sensors.
4. 2024 (Neuralink): Founded by Elon Musk | The N1 Implant | Uses Spike-Sorting Networks for motor intent.
5. 2026 (DRDO India): Created by DRDO & DU | BioFET Chip | Uses Biomarker Modeling for high-altitude heart attacks.

Below the list, there is an image of a human torso with a heart and a chip labeled 'MedTronic 1990-98'. To the right of the image, it says 'Abbott and Medtronic(USA Comp. 60-120 BPM)'. The presentation is being shown in a browser window. On the right side of the Streamyard interface, there are three video feeds of participants: Mohammad Shafi Sofi, Johnson Augustine, and Marvelous Ailegend. At the bottom, there is a chat bar with 'Ask Gemini' and various interaction icons.

AI-Powered Real-Time ECG Analysis- AAFREEN AI MEDTECH

Using Deep Learning. The Core Problem: Traditional ECG analysis requires a cardiologist to manually scan long paper strips, which is time-consuming and prone to human oversight during critical emergencies. Our AI Solution: We have implemented a Convolutional Neural Network (CNN) framework designed to process and analyze ECG signals in real time. How the Model Thinks: Just like a CNN detects edges and shapes in an image, our 1D-CNN scans the continuous time-series voltage of the heart. It automatically learns to recognize structural features like the P-wave, QRS complex, and T-wave. The Visual Impact: What you see on the screen right now is a live simulation of our pipeline. The system processes the streaming raw data, filters out ambient noise, and passes it to the CNN layer. The Clinical Goal: As the graph moves, the model evaluates the distance between heartbeats in milliseconds. If it detects an irregularity, it instantly triggers an alert for conditions like Arrhythmia or Atrial Fibrillation, potentially saving a life before a major cardiac event occurs."

AI-Powered Real-Time ECG Analysis- AAFREEN AI MEDTECH(CTO)

International Online AI Research ...

signals; it is not a cardiac-monitoring device.

Johnson Augustine 15:58

but Neuralink's N1 implant is not designed for heart monitoring. It records brain activity so a person can control a computer using intended movements

the 4th point

Johnson Augustine 16:00

yes yes fine

Outline Slides

1st International Online AI Research & Scientific SUMMIT 2026

Static Websites

- Static websites are web pages that display the same content to every visitor, without any changes based on user interactions. Unlike dynamic websites, which generate content on the fly in response to user actions or database queries, static websites present pre-built HTML, CSS, and JavaScript files.
- Fixed Content:** The content of static websites remains constant for all users and does not change based on user input or interactions. Each page is pre-defined and does not rely on server-side processing.
- Simple Structure:** Static websites typically have a straightforward structure, consisting of HTML files for content, CSS files for styling, and JavaScript files for interactivity (if needed). These files are served directly to users' browsers without the need for server-side processing.
- Limited Interactivity:** While static websites can incorporate some level of interactivity using JavaScript, they are generally less interactive than dynamic websites. They are best suited for presenting information or content that does not require frequent updates or user input.
- Security:** Static websites are generally considered more secure than dynamic websites because they have a smaller attack surface and fewer potential vulnerabilities. With no server-side processing, there are fewer opportunities for attackers to exploit security flaws.
